**Subject:** Re: FW: Standard Chlorine - Screening Level Ecological Risk Assessment

Alison,

Thanks for the opportunity to review this document.

NOAA's primary concern is with site-related contaminants that have been or may continue to be released to the Hackensack River. I understand that the river will be addressed under a separate program. NOAA should be kept informed of the status of any investigations in the river and we would be interested in receiving copies of any documents related to investigations in that portion of the site.

I understand that monthly gauging of piezometers is conducted on either side of the slurry wall around the site (Section 2.4, last paragraph). If chemical data are being regularly collected at these locations, I would appreciate the opportunity to review periodic summaries of those data since they would help us understand the effectiveness of the containment wall. Inclusion of those data in this SLERA would be helpful justification for the conclusion that the wall is working effectively (Section 4.3) at preventing further migration of site-related contamination to the river. If chemical data are not included in those monitoring events, I recommend adding some key constituents to the analyses already being conducted at those locations.

Hope these brief comments are helpful. Please let me know if you have any questions or could use additional information.

- Reyhan.

Below is a link to the Standard Chlorine SLERA. Please let me know if you have comments by June 13.

Thanks and best regards,

Alison

Good Afternoon Alison

You may download an electronic copy of the Screening Level Ecological Risk Assessment for the Standard Chlorine Site from the link below. Feel free to contact me if you have any questions. Thank You

Regards

Jim Zubrow
